

Cluster Headache Imaging Study Brain Activation during Cluster Headache BANG-CH

- Do you have cluster headache?
- Are you 18-60 years old?
- Would you like to help us understand how cluster headache is generated using a new brain scanning technique?

If you have answered yes to these 3 questions then you may be eligible to help us with a study that we are conducting using a technique called functional magnetic resonance imaging (fMRI) to scan the brain during the different phases of a cluster headache attack. The imaging technique does not include harmful radiation and is safe.

This study involves a clinic visit to ensure eligibility with one of the Headache doctors at King's College Hospital followed by a further 3 whole day visits to the Clinical Research Facility at King's College Hospital.

You would be reimbursed for travel and your time.

If you are interested in taking part or would like additional information please contact Dr Diana Wei at the King's College London Headache Group on Clusterheadache-research@kcl.ac.uk
